

ALPHAIT ENGINEERING

Product Engineering. Without Limits.

Software that improves operations and launches new services.

AlphaIT deploys existing systems where they fit, connects the systems already in place, and engineers what is missing.

Company and Product Profile

When work improves, the result becomes visible.

For businesses, institutions and public bodies that need to improve a service, strengthen a decision, reduce avoidable cost or launch something new.

First, we agree the work that needs to get better and how we will know it did. The measure could be completed bookings or sales, lower cost, better service, faster decisions, reliable delivery records or shorter response times.

Find the problem. Put the right system to work.

Start with the operation, not the technology. Show us the service, decision or handoff you need to improve, or the new service you want to launch. We identify what is blocking the work, what is missing and where a better system can create a useful new capability.

WHY THIS IS DIFFERENT

AlphaIT assesses the defined operation to identify practical problems, missing connections and overlooked opportunities. We use a built system where it fits, connect the parts already in place and build only the gap that remains. The result may be less wasted effort, a stronger service or a new capability ready to launch.

Systems already built. Ready to deploy where they fit.

Each product below is a real AlphaIT system. It can be deployed, configured, connected or extended around the operation that needs to improve.

 Verdika Experience into action	 Varren Approved commercial work	 Varren Aegis Platform assurance
 Varren Herald Governed re-engagement	 LisBon Signal Infrastructure (LSI) Financial evidence checking	 LisBon Trust Infrastructure (LTI) Governed credit decisions
 LisCredit Marketplace Credit access marketplace	 Trust App Trusted customer journey	 LisBon Flow Infrastructure (LFI) Connected movement operations
 Flow App Movement experience	 Pollenair Skills participation	 Focused AlphaIT Build Focused engineering route

LisBon systems are engineered by AlphaIT Engineering and owned and operated by LisBon Platforms. **Built and operational means ready for a scoped deployment after the relevant authority, data, integration, legal, commercial and delivery conditions are confirmed.**

Verdika

See what people experience. Put what needs fixing in front of the right people.

Verdika turns feedback, ratings and votes into clear patterns and accountable next actions. It can be configured to send relevant feedback to the responsible stakeholder. Its public civic application lets people rate public leaders and institutions and state what they want changed.

● THE SITUATION

Customers, members, staff or the public have an experience an organisation needs to understand.

● WHAT THE SYSTEM DOES

Verdika captures feedback, ratings and votes, shows the patterns and can route relevant feedback to the responsible stakeholder.

● THE RESULT

Leaders see what people experience, what needs attention and who needs to act next.

Varren

Turn a commercial brief into work your team can approve, run and prove.

Varren turns an approved objective and brand truth into a grounded plan, content and governed action. It keeps approval, timing, destination and proof together, so work is not released blindly and the organisation retains a record of what happened.

● THE SITUATION

Commercial work is scattered between plans, drafts, approvals and channels. No one can clearly show what was approved or what actually happened.

● WHAT THE SYSTEM DOES

Varren prepares the brief, holds consequential steps for approval and sends through authorised connections. It records what happened for later recommendations.

● THE RESULT

Your team sees the objective, draft, approval, chosen destination and verified receipt in one place.

Varren Aegis

Find platform weaknesses before they become customer-visible work.

Varren Aegis watches a live digital platform, runs system checks and scheduled user journeys, then turns a finding into clear work with its cause, priority, responsible role, expected effort and a test for closure. It keeps a record and recommends the next action.

● THE SITUATION

A live platform can appear healthy while a broken flow, risky configuration or weak system behaviour quietly affects customers.

● WHAT THE SYSTEM DOES

Aegis runs scheduled checks and tester journeys. It records each changed finding, explains the cause and raises the next job to the responsible role.

● THE RESULT

Teams see what failed, why it matters, who can act and whether the fix has been verified.

Varren Herald

Give customers a real reason to come back.

Herald finds a meaningful event in the organisation's record, checks the permission rules and uses an approved message only when the contact is justified.

● THE SITUATION

A customer has stopped before an important step in a service or journey.

● WHAT THE SYSTEM DOES

Herald identifies a real occasion, applies contact rules and measures recovery against a held-back group.

● THE RESULT

Teams see the occasion, approval, action and recovery measure in one record.

LisBon Signal Infrastructure (LSI)

Know what the financial records really say.

LSI validates financial records, flags anomalies or possible tampering, and produces structured signals on income, obligations, expenses, cash flow, account stability and document integrity.

● THE SITUATION

A credit team receives financial records that must be checked before a consequential decision.

● WHAT THE SYSTEM DOES

LSI validates records, flags anomalies or possible integrity issues and produces structured signals for the decision workflow.

● THE RESULT

The team sees what the records say, what needs review and the evidence behind it.

LisBon Trust Infrastructure (LTI)

Know who qualifies for credit, what they can safely take and why.

LTI applies verified signals and a lender's own rules to calculate eligibility, affordability and exposure limits, then preserves a replayable decision record. It supports individuals, businesses and institutions.

● THE SITUATION

A lender, fintech or capital provider must decide who may access credit, how much is appropriate and why.

● WHAT THE SYSTEM DOES

LTI applies the lender's rule to verified evidence and produces an eligibility, affordability and exposure decision record.

● THE RESULT

The lender sees the evidence, rule, limit and reason together.

LisCredit Marketplace

Bring verified demand and capital providers together.

LisCredit enables banks, fintechs and funds to assess opportunities and provide capital under their own rules. Capital providers retain their lending decision and risk.

● THE SITUATION

An eligible borrower needs a clearer route to a suitable capital provider.

● WHAT THE SYSTEM DOES

LisCredit matches the borrower to relevant partner routes under each provider's rules.

● THE RESULT

Providers see relevant applications and borrowers see a clearer next step.

Trust App

Build the financial profile behind your next credit application.

Trust App lets people submit financial records, see their Trust Profile and available credit access, and view relevant opportunities. It can also be deployed as a lender-branded customer journey.

● THE SITUATION

A person needs to understand their financial standing before they seek access.

● WHAT THE SYSTEM DOES

Trust App turns the available evidence into a clear profile and next step.

● THE RESULT

People see their profile and providers retain a connected customer journey.

LisBon Flow Infrastructure (LFI)

Run your movement business. Keep your brand and customers.

LFI gives transport, logistics and delivery businesses and operators booking, customer access, driver operations, dispatch, routes, delivery and settlement in one environment. It can be deployed under the operator's own brand, pricing and customer relationship.

● THE SITUATION

A transport, logistics or delivery business runs bookings, routes, teams and service updates across disconnected tools.

● WHAT THE SYSTEM DOES

LFI connects booking, customer access, driver operations, dispatch, routes, delivery and settlement around the real service.

● THE RESULT

The business sees what is moving, who owns the next task and what needs attention.

Flow App

Every route, booking and update in one place.

Flow App gives customers, drivers and operators a clear experience of booking, execution and status within an LFI deployment. It is the customer-facing experience, not a generic standalone app.

● THE SITUATION

A customer or driver needs a clear view of the journey that is happening now.

● WHAT THE SYSTEM DOES

Flow App presents the booking, route, task and service update around the real movement.

● THE RESULT

Every person involved sees the next step without leaving the operator's service.

Pollenair

Show which learners can use what they learned.

Pollenair delivers interactive skill pathways and gives institutions a clear view of participation, progress and completion across a sponsored programme.

● THE SITUATION

A sponsor needs to see whether a learning programme is reaching people and moving them forward.

● WHAT THE SYSTEM DOES

Pollenair gives learners practical pathways and gives sponsors a view of progress and completion.

● THE RESULT

Programme teams see participation, progress and where support is needed.

Focused AlphaIT Build

Find the missing piece. Build the system that makes the operation work.

When a ready system does not fully fit, AlphaIT studies the real operation, finds the missing handoff, information or control, then architects and engineers the connected solution.

● THE SITUATION

A ready system covers much of an operation, but a missing handoff, control or data connection still creates delay, rework or avoidable cost.

● WHAT THE SYSTEM DOES

AlphaIT maps the real operation, identifies the gap and engineers the smallest connected solution that closes it.

● THE RESULT

The team sees a complete working route and can measure the change in cost, delay, revenue opportunity, service or control.

Bring us the work that matters most.

We will help you choose the fastest credible route: deploy what is ready, connect what is fragmented or engineer what is missing.
