

ALPHAIT ENGINEERING

Product Engineering. Without Limits.

Improve operations. Launch new services.

AlphaIT Engineering deploys and builds the systems businesses, institutions and governments use to create revenue opportunities, improve services and strengthen critical operations.

Company and Product Profile

When work improves, the result becomes visible.

For businesses, institutions and governments that need to create revenue opportunities, improve a service, strengthen a decision, reduce avoidable cost or launch something new.

We begin with the outcome. Together, we define what should improve or launch and choose a clear measure that will show whether it worked. That measure could be more completed bookings or sales, lower cost, better service, faster decisions, reliable delivery records or shorter response times.

Outcome first. The right system next.

Show us the revenue opportunity, service or operation. We identify the strongest route: deploy a system already engineered, connect what is fragmented or engineer the capability that remains missing.

WHY THIS IS DIFFERENT

AlphaIT starts with the result the organisation needs. We find the opportunity, operating constraint or missing connection, use a built system where it fits and engineer only the gap that remains. This creates a faster route to new revenue, better services, lower cost or stronger operations.

Systems already engineered. Ready for the right operation.

Each product below is an AlphaIT-built system. It can be licensed, deployed, configured, connected or extended around the outcome the organisation needs.

 Verdika Experience intelligence and accountability	 Varren Governed organisational execution	 Varren Aegis Platform assurance
 Varren Herald Measured customer re-engagement	 LisBon Signal Infrastructure (LSI) Financial data-truth infrastructure	 LisBon Trust Infrastructure (LTI) Trust and credit decision infrastructure
 LisCredit Marketplace Credit marketplace infrastructure	 Trust App Consumer financial trust application	 LisBon Flow Infrastructure (LFI) Route operations infrastructure
 Flow App Operations application	 Pollenair Practical capability infrastructure	 Focused AlphaIT Build Focused product engineering

LisBon systems are engineered by AlphaIT Engineering and owned and operated by LisBon Platforms. **Built and operational means ready for a scoped deployment after the relevant authority, data, integration, legal, commercial and delivery conditions are confirmed.**

Verdika

See what people experience. Fix what matters next.

Verdika turns ratings, reviews, feedback and participation into a clear view of what people experience, what keeps going wrong and what needs attention. It connects recurring patterns with the responsible team, the response and what people experience afterwards.

Varren

Tell Varren what needs to happen.

Varren is the governed operator AlphaIT is building to turn organisational intent into planned, authorised, executed and verified work. It brings intelligence, connected tools, approvals, evidence and continuous improvement into one operating experience.

Varren Aegis

Attack your platform before anyone else does, then prove it is fixed.

Varren Aegis watches, attacks and witnesses a digital platform, then holds every finding open until the check that found it passes again. It can examine security, performance, integrations, user experience, business logic, billing and releases.

● THE SITUATION

A platform can look healthy while a security boundary, payment, journey, integration or pricing rule is already failing.

● WHAT THE SYSTEM DOES

Sentinel watches. Crucible attacks. Witness sees what real users hit. Warden keeps the finding open until a repeat check proves the fix.

● THE RESULT

Teams see the verdict, the exact finding, its cause, priority, responsible role, recommended fix and verified closure.

Varren Herald

Bring customers back with something true to say.

Varren Herald finds people who stopped partway, waits for a real reason to return, checks permission, uses approved wording and measures what came back against a group left alone.

● THE SITUATION

People start an application, purchase, enrolment or service journey and stop, while the organisation cannot tell who may be contacted or what would genuinely matter.

● WHAT THE SYSTEM DOES

Herald finds where they stopped, identifies a true occasion, checks lawful contact rules, locks approved wording and holds back a comparison group.

● THE RESULT

The organisation sees who was reachable, what was sent or refused, why, and how many reached the goal compared with people left alone.

LisBon Signal Infrastructure (LSI)

Turn financial records into evidence systems can trust.

LSI ingests, validates and structures financial records before they influence a consequential decision. It checks source integrity, identifies financial activity and produces governed signals with clear confidence.

LisBon Trust Infrastructure (LTI)

Turn governed evidence into decisions you can explain, control and replay.

LTI is deterministic infrastructure for governing financial trust, eligibility, authorisation, exposure and credit obligations. It preserves the evidence, rules, state and history behind each consequential decision.

LisCredit Marketplace

Bring qualified demand and the right capital together.

LisCredit brings multiple sources of qualified demand and multiple capital providers into one controlled marketplace. It can be deployed as a marketplace, embedded in an existing platform or connected to participating providers.

● THE SITUATION

Qualified people and businesses need suitable capital, while providers need relevant demand that fits their products and rules.

● WHAT THE SYSTEM DOES

LisCredit brings qualified demand, applicable products, provider routes, offers and origination workflows into one governed marketplace journey.

● THE RESULT

Operators see both sides of the market, providers see relevant opportunities and qualified applicants see the routes available to them.

Trust App

Your bank statement, turned into trust.

LisBon Trust App gives people a clear way to submit or connect financial evidence, see their Trust Profile and carry that context into credit-access journeys. It is the consumer surface of the LisBon financial infrastructure.

● THE SITUATION

A person or microbusiness has financial activity, but the evidence remains trapped in documents and difficult for institutions to understand.

● WHAT THE SYSTEM DOES

The app connects the user to governed financial evidence, a Trust Profile and the relevant next action without taking over the provider decision.

● THE RESULT

The user sees what evidence was accepted, the trust context available and which action is possible next.

LisBon Flow Infrastructure (LFI)

Give recurring physical operations one operating truth.

LFI coordinates route-based work across operators, jobs, assets, locations, execution states and completion records. It gives transport, logistics, delivery and field-service organisations one authoritative view of what should move and what actually happened.

● THE SITUATION

Routes, jobs and field work are split across calls, messages, paper, spreadsheets and disconnected systems.

● WHAT THE SYSTEM DOES

LFI maintains the operating state behind scheduled work, assignments, execution, completion, exceptions and history.

● THE RESULT

Managers and field teams see the same operation from the view appropriate to their role.

Flow App

Run work on the move from one operating view.

LisBon Flow is the role-specific operating application for organisations using LFI. Managers, dispatchers, drivers and field operators see the work, ownership, current state, completion and exceptions relevant to them.

● THE SITUATION

Different people in a movement operation need different views of the same work, but still need one shared operating truth.

● WHAT THE SYSTEM DOES

Flow gives each authorised role the appropriate view while every action remains connected to the state held in LFI.

● THE RESULT

A field update changes the manager view immediately because both roles work against the same operation.

Pollenair

Make practical learning and capability visible.

Pollenair turns learning activity, practical work and demonstrated progress into a clearer record of what someone is learning, practising and becoming capable of doing.

Focused AlphaT Build

Engineer the system behind your next opportunity.

When an existing AlphaT system does not fully fit, we map the real operation, find the missing capability or connection and engineer the focused system required to improve the work or launch the new service.

Bring us the work that matters most.

Show us the revenue opportunity, service or critical operation. We will identify the strongest starting point, the system route and the evidence required to move forward.
